Bleeding from the Nose
(Epistaxis)

Basics

OVERVIEW
• Bleeding from the nose

SIGNALMENT/DESCRIPTION OF PET
Species
• Dogs
• Cats
Breed Predilections
• Varies, depending on underlying cause
Mean Age and Range
• Varies, depending on underlying cause
Predominant Sex
• Varies, depending on underlying cause

SIGNS/OBSERVED CHANGES IN THE PET
• Bleeding from one or both nostrils (nasal hemorrhage)
• Sneezing
• May see evidence of bleeding from other areas of the body if nosebleed related to blood-clotting disorder (known as "coagulopathy"), such as blood in the stool (known as "hematochezia"); dark black, tarry stool due to the presence of digested blood (known as "melena"); blood in the urine (known as "hematuria")
• High-pitched, noisy breathing (known as "stridor")—may be present with cancer, foreign body, or advanced inflammatory disease of the nose
• May see bruising or blood-filled swellings (hematomas) if nosebleed related to blood-clotting disorder (coagulopathy)
• May have vision disorders due to bleeding in the retina (retinal hemorrhages) with blood-clotting disorders (coagulopathy) or high blood pressure (known as "hypertension")

CAUSES
• Bleeding from the nose results from one of three abnormalities—bleeding disorders or blood-clotting disorders (coagulopathies); presence of a local lesion; blood vessel (vascular) or generalized (systemic) disease

Bleeding Disorders or Blood-Clotting Disorders (Coagulopathies)
Low Number of Platelets or Thrombocytes in the Blood (known as "Thrombocytopenia")
• Immune-mediated disease—thrombocytopenia for unknown reason (so-called "idiopathic disease"); systemic
lupus erythematosus (SLE); drug reaction; modified-live vaccine (MLV) reaction

- Infectious disease—*Ehrlichia* infection; Rocky Mountain spotted fever; *Babesia* infection; feline leukemia virus (FeLV) - or feline immunodeficiency virus (FIV)-related illness
- Bone-marrow disease—cancer; aplastic anemia, where the bone marrow is not generating blood cells; infectious disease (fungal, rickettsial, or viral)
- Disorders that accompany cancer (known as "paraneoplastic disorders")
- Blood clotting disorder—disseminated intravascular coagulopathy (DIC), a bleeding problem in which clotting factors are activated and clotting factors and platelets are used up

### Abnormal Function of Platelets or Thrombocytes in the Blood (Known as "Thrombopathia")

- **Congenital (present at birth)**—von Willebrand’s disease (bleeding disorder caused by lower than normal levels of factor VII—one of the ingredients required to clot blood); abnormally functioning platelets (thrombopathia)
- **Acquired (present after birth)**—nonsteroidal anti-inflammatory drugs (NSAIDs); clopidogrel (a medication to prevent strokes and heart attacks in people); increased levels of globulin, a body protein, in the blood (known as "hyperglobulinemia"; may be seen with *Ehrlichia* infection or multiple myeloma); increased concentration of nitrogenous waste products including urea in the blood (known as "uremia"); blood clotting disorder—disseminated intravascular coagulopathy

### Blood-Clotting (Coagulation) Factor Defects

- Blood-clotting (coagulation) factors are present in the plasma of the blood. They are ingredients that come together in a certain order to produce a clot. The clotting factors are identified by Roman numerals, I through XII. If one or more blood-clotting factor is present in too low a level or if the blood clotting factors have been used up, clotting will not occur normally and bleeding will result. The amount of bleeding varies.
- **Congenital (present at birth):** hemophilia A (factor VIIIc deficiency) and hemophilia B (factor IX deficiency)
- **Acquired (present after birth):** poisoning with agents used to kill rodents (mice, rats)—these agents (known as "anticoagulant rodenticides," such as warfarin) prevent blood clotting; liver disease; and disseminated intravascular coagulopathy, a bleeding problem in which clotting factors are activated and clotting factors and platelets are used up

### Local Lesion

- **Foreign body**
- **Trauma**
- **Infection**—fungal (*Aspergillus, Cryptococcus*, and *Rhinosporidium*); viral or bacterial; usually see blood-tinged nasal discharge rather than obvious bleeding
- **Cancer**
- **Dental disease**—abnormal opening between the mouth and nose (known as an "oronasal fistula"), tooth-root abscess
- **Inflammation of the nasal tissues, characterized by the presence of lymphocytes and plasma cells (so-called "lymphoplasmacytic rhinitis")**

### Blood Vessel (Vascular) or Generalized (Systemic) Disease

- **High blood pressure (known as "hypertension")—kidney disease; excessive production of thyroid hormone (known as "hyperthyroidism"); excessive production of steroids by the adrenal glands (known as "hyperadrenocorticism" or "Cushing’s disease"); high blood pressure caused by unknown reason (known as "idiopathic disease")
- **Increase in proteins in the serum of the blood (known as "hyperviscosity")— increased levels of globulin, a body protein, in the blood (hyperglobulinemia), may be seen with *Ehrlichia* infection or multiple myeloma (cancer of the bone marrow in which abnormal proteins are produced); increased number of red blood cells (known as "polycythemia")
- **Inflammation of the blood vessels (known as "vasculitis")—immune-mediated and rickettsial diseases**

### RISK FACTORS

#### Coagulopathy

- Immune-mediated disease—young to middle-aged, small to medium-sized female dogs
- Infectious disease—dogs living in or traveling to areas where other dog or animals are carrying the infection-causing organism; tick exposure
• Abnormality of the platelets (thrombasthenia)—otter hounds
• Abnormal functioning of the platelets (thrombopathia)—basset hounds, spitz
• von Willebrand’s disease—Doberman pinschers, Airedale terriers, German shepherd dogs, Scottish terriers, Chesapeake Bay retrievers, and many other breeds; cats
• Hemophilia A—German shepherd dogs and many other breeds; cats
• Hemophilia B—cairn terriers, coonhounds, Saint Bernards, and other breeds; cats

Local Lesion
• Aspergillosis—German shepherd dog, rottweiler
• Cancer—long-nosed dogs (known as "dolicocephalic breeds")

Treatment

Health Care
• Blood-clotting disorder (coagulopathy)—usually inpatient management
• Mass or space-occupying lesion or blood vessel (vascular) or generalized (systemic) disease—outpatient or inpatient management, depending on the disease and its severity
• Provide basic supportive care (such as intravenous fluids, quality nutrition)
• Radiation therapy—nasal tumors; various response rates, depending on tumor type
• Recognize signs of serious bleeding (such as weakness, collapse, pallor, and obvious blood loss)
• Whole-blood or packed red blood-cell (RBC) transfusion—may be needed with severe anemia

Activity
• Minimize activity or stimuli that may lead to or increase bleeding episodes

Surgery
• Removal of foreign body
• Fungal infection of the nose (known as "fungal rhinitis," such as caused by Aspergillus and Rhinosporidium) may require surgical removal of part of the space-occupying lesion (known as "debulking")

Medications
Medications presented in this section are intended to provide general information about possible treatment. The treatment for a particular condition may evolve as medical advances are made; therefore, the medications should not be considered as all inclusive

Coagulopathy
• Immune-mediated disease—prednisone; additional medications may be used for cases that do not respond to prednisone alone, such as azathioprine, cyclosporine, human immune globulin
• Infectious disease—Rickettsial disease: doxycycline; Babesia infection: imidocarb, diminazene, or atovaquone with azithromycin
• Bone-marrow cancer—chemotherapy
• Abnormal platelet function or platelets (thrombopathia or thrombasthenia)—no treatment in most cases
• Von Willebrand’s disease—plasma or cryoprecipitate for sudden bleeding; desmopressin acetate or DDAVP is a synthetic antidiuretic hormone; DDAVP may help control or prevent bleeding
• Hemophilia A—plasma or cryoprecipitate for acute bleeding; no long-term treatment
• Hemophilia B—plasma for acute bleeding; no long-term treatment
• Rat poisoning (anticoagulant rodenticide poisoning)—plasma for acute bleeding; vitamin K, length of time for vitamin K treatment based on type of rat poison to which pet was exposed

Local Lesion
• Serious bleeding—control with cage rest and acepromazine to lower blood pressure and promote clotting if the pet does not have a decrease in blood volume (known as "hypovolemia")
• Secondary bacterial infection—antibiotics; based on culture and sensitivity testing
• Fungal infection—topical treatment with clotrimazole or enilconazole; Aspergillosis; dapsone following surgery for rhinosporidiosis
BLOOD VESSEL (VASCULAR) OR GENERALIZED (SYSTEMIC) DISEASE
• Increase in proteins in the serum of the blood (known as "hyperviscosity")—treat underlying disease (such as *Ehrlichia* infection and multiple myeloma)
• Inflammation of the blood vessels (vasculitis)—prednisone for immune-mediated disease; doxycycline for rickettsial disease

HIGH-BLOOD PRESSURE (HYPERTENSION)
• Treat underlying disease—kidney disease, excessive production of thyroid hormone (known as "hyperthyroidism"); excessive production of steroids by the adrenal glands (known as "hyperadrenocorticism" or "Cushing's disease")
• Reduce weight
• Restrict sodium
• Calcium channel blockers—amlodipine; diltiazem
• Angiotensin-converting enzyme (ACE) inhibitors—benazepril; enalapril
• β-blockers—propranolol; atenolol
• Diuretics—hydrochlorothiazide; furosemide

Follow-Up Care

PATIENT MONITORING
• Depends on underlying cause; discuss with your pet's veterinarian
• Platelet count for pets with low platelet counts (thrombocytopenia)
• Blood-clotting (coagulation profile) for pets with blood-clotting (coagulation) factor defects
• Blood pressure for pets with high blood pressure (hypertension)
• Clinical signs

PREVENTIONS AND AVOIDANCE
• Depends on underlying cause; discuss with your pet's veterinarian
• Prevent exposure to rat poisons (anticoagulant rodenticide poisons)
• Provide dental preventive care

POSSIBLE COMPLICATIONS
• Anemia and collapse (rare)

EXPECTED COURSE AND PROGNOSIS
• Depends on underlying cause

Key Points
• Bleeding from the nose results from one of three abnormalities—bleeding disorders or blood-clotting disorders (coagulopathies); presence of a local lesion; blood vessel (vascular) or generalized (systemic) disease
• May see bleeding from other areas of the body if nosebleed related to blood-clotting disorder (known as "coagulopathy")
• Recognize signs of serious bleeding (such as weakness, collapse, pallor, and obvious blood loss)
